Employee Workforce Performance Dashboard

Project problem statement, terminology, KPI definitions and analytical scope

1. Problem statement

HR leaders need a consistent view of employee headcount, departures, tenure, workforce distribution and performance-related measures. Employee-level spreadsheets make it difficult to compare departments and locations or assess how employee status changes the workforce mix. This project organizes employee records into an Excel dashboard supported by PivotTables, calculated KPIs, charts and slicers. It is descriptive workforce reporting, not a predictive attrition or causal analysis model.

2. Objectives

- Summarize employee records by employment status and calculate the observed attrition share.
- Compare workforce distribution across departments, locations, job levels and other categories.
- Report average tenure and review training, attendance and performance fields.
- Allow users to explore segments through slicers and refresh source-backed PivotTables.

3. Workbook inventory

Employee_Data (A2:S787): 785 employee records, 19 columns; Pivot: KPI calculations and supporting PivotTables; Dashboard: formatted reporting canvas with charts and interactive controls. The workbook includes seven chart XML definitions, five slicer caches and an embedded VBA project.

4. Headline measures

Measure	Workbook value
Total employees	785
Active employees	561
Attrition records	224
Attrition share	28.54% = 224 / 785
Average tenure	5.09 years (Pivot result)

5. Data dictionary

Field	Meaning / caution
Employee ID	Unique employee identifier; do not publish real identifiers.
Employee Name	Employee name; remove from public samples.
Gender	Recorded gender category; avoid assumptions about identity.
Age	Recorded employee age in years; validate against source date.
Department	Organizational department.
Job Level	Seniority or job grade.
Location	Employee work location.

Employment Type	Full-time or other contractual classification.
Hire Date	Start of employment; Excel date serial in workbook storage.
Exit Date	Recorded departure date; blank for many active employees.
Employment Status	Active or Attrition; source-defined employee state.
Annual Salary (INR)	Annual compensation denominated in Indian rupees.
Performance Rating	Categorical performance assessment.
Training Hours	Reported hours of training.
Attendance %	Attendance rate stored on a 0–100 scale; divide by 100 for Excel percent formatting.
Promotion in Last 12 Months	Yes/No promotion flag.
Year	Derived reporting year; verify whether based on hire date.
Month	Derived reporting month; verify whether based on hire date.
Tenure	Tenure in years; inspect row formula and reporting date before reproducing.

6. KPI definitions and Excel logic

- Total employee records: =GETPIVOTDATA("Employee ID",Pivot!$D$5) — workbook Pivot!B6.
- Active employees: =GETPIVOTDATA("Employee ID",Pivot!$D$5,"Employment Status","Active") — Pivot!B7.
- Attrition records: =GETPIVOTDATA("Employee ID",Pivot!$D$5,"Employment Status","Attrition") — Pivot!B8.
- Attrition share: =B8/B6 — Pivot!B9. This is the proportion of employee records marked Attrition, not necessarily an annual turnover rate.
- Average tenure: =GETPIVOTDATA("Tenure",Pivot!$D$17) — Pivot!B10.
- Department attrition share: count of Attrition records in department / all records in department, using GETPIVOTDATA on the relevant PivotTables.

7. Data quality and publication considerations

- Employee-level personal information is present; use synthetic/anonymized names and identifiers for public GitHub releases.
- Confirm whether employees and departures refer to the same reporting period before interpreting attrition as turnover.
- Review hire/exit date consistency and the precise Tenure, Year and Month formulas.
- Check slicer filtering and refresh behavior; cached PivotTable values may not update until refreshed.
- Avoid making individual HR decisions or inferring causes of attrition from descriptive associations.

8. Portfolio description

Built an interactive Excel workforce dashboard using 785 employee records to analyze headcount, employee status, attrition share, tenure and workforce segmentation. Applied PivotTables, GETPIVOTDATA, charts and slicer-driven reporting, with documented data-quality and privacy limitations.
